# 1 EXECUTIVE SUMMARY

ADG Engineers (Aust.) Pty Ltd has been engaged by Engine Room VM (NSW) Pty Ltd to prepare a Stormwater Management Plan suitable for submission to Meander Valley Council in support of a Development Application for a residential subdivision located across a portion of 100 Country Club Avenue, Prospect Vale, TAS 7250.

The proposed development is to be primarily comprised of detached residential dwellings, retirement living units and a retail area around the existing golf course.

This report aims to assess the proposed development with relation to both stormwater quantity and quality. The quantity assessment is undertaken to confirm a 'non-worsening' of peak flow discharges from the site and the quality assessment is undertaken to determine the required stormwater treatment measures to be implemented on site.

A stormwater management plan is required to comply with the Council Planning Scheme, the Tasmanian Regional Subdivisional Guidelines, and the State Stormwater Strategy, which stipulates requirements regarding the removal of gross pollutants, suspended solids, nitrogen and phosphorus.

The stormwater quantity objective was to demonstrate that there is no increase in peak discharges from the subject site. This considered storm events up to and including the 1% AEP ( $Q_{100}$ ) storm event. The purpose is to ensure that the existing infrastructure and/or downstream properties are not adversely affected. The above-mentioned objectives are achieved through the use of detention storage measures.

All relevant standards and guidelines are addressed in this Stormwater Management Plan including the State Stormwater Strategy, the Meander Valley Planning Scheme and the MUSIC Modelling Guidelines, Version 1.0 (2010). The proposed stormwater quantity and quality solutions are summarised in the following table:

**Table 1 - Proposed Stormwater Quantity and Quality Solutions**

| Catchment | Quantity Mitigation Requirement  | Quality Mitigation Requirement  |
|-----------|--|---|
| C1        | 873.5m <sup>3</sup> of On-Site Detention within combined treatment / detention basin | 180m <sup>2</sup> of Bioretention within combined treatment / detention basin |
| C2        | Additional 11,768.5m <sup>3</sup> of On-Site Detention within existing East Lake     | 120m <sup>2</sup> of Bioretention within combined treatment / detention basin |
| C7        |  | 25m <sup>2</sup> of Bioretention within combined treatment / detention basin  |
| C3        | Additional 12,153.6m <sup>3</sup> of On-Site Detention within existing West Lake     | 160m <sup>2</sup> of Bioretention within combined treatment / detention basin |
| C5        |  | 95m <sup>2</sup> of Bioretention within combined treatment / detention basin  |
| C4        | 15.5m <sup>3</sup> of On-Site Detention within combined treatment / detention basin  | 26m <sup>2</sup> of Bioretention within combined treatment / detention basin  |
| C6        | 143.3m <sup>3</sup> of On-Site Detention within combined treatment / detention basin | 28m <sup>2</sup> of Bioretention within combined treatment / detention basin  |

## 2 INTRODUCTION

### 2.1 General

ADG Engineers (Aust.) Pty Ltd has been engaged by Engine Room VM (NSW) Pty Ltd to prepare a Stormwater Management Plan suitable for submission to Meander Valley Council (MVC) in support of a Development Application for a residential subdivision located across a portion of 100 Country Club Avenue, Prospect Vale, TAS 7250, henceforth referred to as *the site*.

The proposed development is to be primarily comprised of detached residential dwellings, retirement living units and a retail area around the existing golf course.

This report aims to assess the proposed development with relation to both stormwater quantity and quality. The quantity assessment is undertaken to confirm a 'non-worsening' of peak flow discharges from the site and the quality assessment is undertaken to determine the required stormwater treatment measures to be implemented on site.

The purpose of this SMP is to provide advice as to the development proposal detailed in the Place Design Group drawings in **Appendix A**. The works described herein are subject to further approvals and cover works required to service the proposed development with regard to stormwater treatment.

### 2.2 Background Information

This report was compiled using information from the following sources:

- ▶ 'Dial Before You Dig' (DBYD) As-Constructed information;
- ▶ Tasmanian Government ListData;
- ▶ Architectural drawings by Place Design Group (refer to **Appendix A**);
- ▶ Detailed survey plan prepared by Woolcott Surveys (refer to **Appendix B**); and
- ▶ Google Maps Aerial Imagery.

### 2.3 Property Details

The site is located in Prospect Vale, TAS. The land titles that make up the site are given in **Table 1**. Refer to the architectural drawings in **Appendix A** for further details. **Figure 1** displays the site locality.

Table 2– Property Detail

|                |   |
|----------------|---|
| Title          | P119422   |
| Street Address | 100 Country Club Avenue, Prospect Vale 7250 TAS |
| Site Area      | 1,156,639m <sup>2</sup> (115.664 ha)            |
| Area of Works  | 37.620ha  |

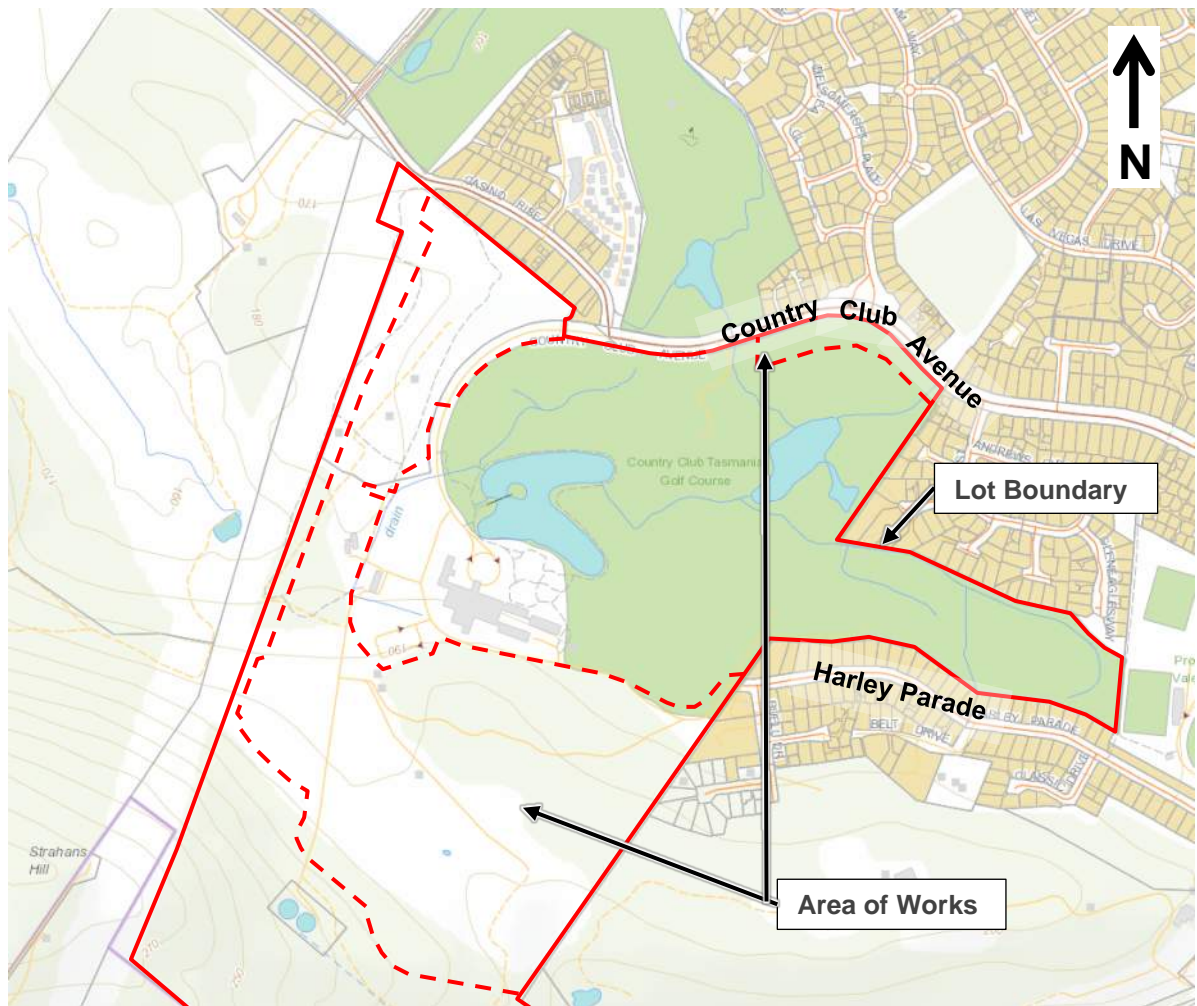

Figure 1 – Locality Map (Accessed on 19.10.2020 from MVC Discover Communities Mapping)

## 2.4 Existing Site

The proposed development is located over sections of undeveloped land on 100 Country Club Avenue, Prospect Vale, TAS. Prospect Vale is within the MVC local government area and thus will be assessed by MVC officers. The proposed area of works generally falls from a high of 220m AHD in the south to local low points of 168m AHD in the north-east.

The site is subject to a steep grade, which varies from over 20% to 5%.

Much of the existing site is occupied by the existing Country Club Golf Course, the associated clubhouse and car parking. The existing golf course is the confluence point for the surrounding catchment and several existing water bodies are located there. The flows continue north via culverts under Country Club Avenue at two points.

**Figure 2** demonstrates the existing site conditions discussed above.

The existing lot on which the site is located is burdened by an existing electrical easement in the west and an existing trunk water main easement passes from a reservoir in the south, through the centre of the site towards the north. A drainage easement is located in the north-west of the existing lot. Refer to the survey in **Appendix B** for further details.

Figure 2 – Site Condition (Source: Nearmap, dated 02.03.2020)

### 3 PROPOSED DEVELOPMENT

The proposed development as described in the architectural drawings in **Appendix A** is to be primarily comprised of detached residential dwellings, retirement living and a retail area around the existing golf course.

The surface areas exposed to rainfall for the proposed development is presented in **Table 3**. Refer to the architectural drawings in **Appendix A** and DA08 in **Appendix C** for further information regarding the proposed development.

**Table 3 – Proposed Development Areas**

| Catchment ID | Land Type       | Impervious    | Area (ha)     |
|--------------|-----------------|---------------|---------------|
| C1           | Roof Area       | 100.00%       | 4.065         |
|              | Ground          | 37.00%        | 5.600         |
|              | Road / Driveway | 100.00%       | 1.295         |
| C2           | Roof Area       | 100.00%       | 2.579         |
|              | Ground          | 37.00%        | 3.318         |
|              | Road / Driveway | 100.00%       | 1.023         |
| C3           | Roof Area       | 100.00%       | 3.347         |
|              | Ground          | 37.00%        | 4.543         |
|              | Road / Driveway | 100.00%       | 1.480         |
| C4           | Roof Area       | 100.00%       | 0.724         |
|              | Ground          | 37.00%        | 0.736         |
| C5           | Roof Area       | 100.00%       | 2.202         |
|              | Ground          | 37.00%        | 2.537         |
|              | Road / Driveway | 100.00%       | 0.691         |
| C6           | Roof Area       | 100.00%       | 0.680         |
|              | Ground          | 37.00%        | 0.780         |
|              | Road / Driveway | 100.00%       | 0.210         |
| C7           | Roof Area       | 100.00%       | 0.789         |
|              | Ground          | 37.00%        | 0.661         |
| <b>TOTAL</b> |                 | <b>68.24%</b> | <b>37.260</b> |

Note: Assumed lot breakdown – 29% pervious ground, 68% impervious roof, 17% impervious ground. Assumed road reserve breakdown: 50% pervious ground, 50% impervious road. Overall Fraction impervious 68% based on advice provided by Meander Valley Council, as per **Appendix F**.

#### 3.1 Existing Stormwater Infrastructure

Meander Valley Council infrastructure mapping in addition to the attached detailed site survey has identified the following stormwater infrastructure within the vicinity of the site:

- Overland flow paths and are the primary means of flow conveyance through the site, leading to artificial open drains lower in the catchment. In the vicinity of the existing golf course culverts have been provided under pedestrian bridges over the open drains.
- Culverts convey flows from the southern side of Country Club Avenue to the northern side at two points as described below.
- A DN800 Stormwater culvert conveys flows from south to north under Country Club Avenue approximately 60m east from the centre of the Country Club Avenue – Casino Rise intersection.
- 2x DN1125 Stormwater culverts conveys flows from south to north under Country Club Avenue approximately 210m east from the centre of the Country Club Avenue – Casino Rise intersection.
- The west end of Country Club Avenue is serviced by an open-channel swale in the eastern verge. Pits and pipes convey flows from the western kerb and channel to the swale at intervals along the road.
- Existing drainage structures are present around the existing golf course and the associated club house.

### 3.2 Lawful Point of Discharge (LPD)

The existing area of works is characterised by multiple catchments that fall to the north, east and south. As such the site has multiple points of discharge. It is proposed that for most catchments the existing discharge points will be retained by the post-developed site. Refer to the attached DA07 and DA08 to see the existing and proposed points of discharge. **Table 4** presents the different LPDs for each catchment.

**Table 4 – Catchment LPDs**

| Catchment | Lawful Point of Discharge |
|-----------|---------------------------|
| C1        | LPD1                      |
| C2        | LPD7                      |
| C3        |                           |
| C4        | LPD4                      |
| C5        | LPD7                      |
| C6        | LPD6                      |
| C7        | LPD7                      |

### 3.3 External Catchments

The land to the east, west and south of the site falls towards the site boundary. As such there are several external catchments that burden the site. Refer to the attached DA07 and DA08 to see the external catchments. These external catchments will be conveyed through the site via a combination of culverts and overland flow paths capable of conveying the 1% AEP flow event.

### 3.4 Flooding

Refer to the ADG Engineering Services Report (23337 C R001) for flooding impacts.

## 4 STORMWATER QUANTITY ASSESSMENT

The aim of the stormwater quantity assessment is to ensure that the development shall impose no adverse effects on downstream properties or receiving water bodies and that the conveyance of flows will be in a safe manner with minimal risk of human endangerment as well as the following objectives:

- ▶ Address the need for stormwater quantity control measures;
- ▶ Ensure there is no increase in peak discharges from the subject site for events up to and including the 1% Annual Exceedance Probability (formerly known as the 1 in 100 year Annual Recurrence Interval) event; and
- ▶ Ensure proposed quantity control measures detain and convey flows in accordance with MVC minimum freeboard recommendations.

### 4.1 Proposed Development and Associated Issues

The impervious area increases from the pre-development case across the proposed area of works. One of the major implications of an increase in impervious area is that the total volume and flow rate of stormwater run-off from the catchment will generally increase. It can subsequently be concluded that the development across the area of works alters the existing flow characteristics of the site. It is essential that any increase to post-developed peak site discharge over pre-developed peak site discharge are mitigated.

### 4.2 Stormwater Quantity Modelling – XP-STORM

An XP-STORM Hydraulic and Runoff model was created to analyse the pre- and post-developed scenarios. The model includes a typical node-link connectivity identifying the catchments and hydraulic parameters. The proposed model was designed to reduce the increase of developed runoff to match pre-developed levels.

The AR&R Storm Generator was used based on the site coordinates to run all design storm events for events from the 10-minute storm to the 72-hour storm events. The Bureau of Meteorology Intensity-Frequency-Duration data applied to AR&R storm patterns is shown in **Table 6**.

Table 5 - BOM Intensity Frequency Data for Site (mm/hr)

| Storm Duration | Annual Exceedance Probability (%) |         |         |        |        |        |
|----------------|-----------------------------------|---------|---------|--------|--------|--------|
|                | 50% AEP                           | 20% AEP | 10% AEP | 5% AEP | 2% AEP | 1% AEP |
| 10 mins        | 36.7                              | 49.0    | 58.4    | 68.3   | 83.2   | 95.8   |
| 15 mins        | 29.8                              | 39.9    | 47.6    | 55.8   | 68.1   | 78.6   |
| 20 mins        | 25.6                              | 34.2    | 40.8    | 47.7   | 58.1   | 66.9   |
| 25 mins        | 22.6                              | 30.2    | 36.0    | 42.0   | 51.0   | 58.5   |
| 30 mins        | 20.5                              | 27.3    | 32.4    | 37.7   | 45.5   | 52.0   |
| 45 mins        | 16.3                              | 21.6    | 25.4    | 29.5   | 35.1   | 39.7   |

#### 4.2.1 XP- Modelling Assumptions and Methodology

The following modelling assumptions were used to create the XP-STORM Models:

- ▶ Laurenson's method was used for catchment routing with an 'n' value of -0.285 and 'B' value calculated by XP-STORM.
- ▶ Infiltration was modelled as 'uniform loss' with the following parameters:
  - Impervious Areas
    - Initial loss of 1.0mm;
    - Continuing loss of 0.1mm/hr; and
    - Appropriate Manning's 'n' to suit the surface.
  - Pervious Areas
    - Initial loss of 19.0mm;
    - Continuing loss of 4.8mm/hr; and
    - Appropriate Manning's 'n' to suit the surface.
  - Note: initial and continuing losses were determined based on the AR&R 2016 storm generator values, which were calculated based on the site coordinates.
- ▶ Separate catchments were generated, which were:
  - External Catchments; 'EXT1', 'EXT3', 'EXT4', 'EXT5', 'EXT6' and 'EXT7'. External catchments were assumed to be 50% impervious in developed areas, based on sample areas.
  - Pre-Development Catchments; 'EX1', 'EX2', 'EX3', 'EX4', 'EX6', 'EX7' and 'EX8'; and
  - Post-Development Mitigated Catchments; 'C1', 'C2', 'C3', 'C4', 'C5', 'C6', 'C7' and 'C8';

- The detention basins and existing lakes were modelled using a step-wise-linear area-depth relationship with preliminary basin dimensions estimated using the concept lot layout plan and post-development contours. The lake dimensions were based on the detailed site survey in **Appendix B**;
- Each node included runoff sub-catchments simulating the contributing areas;
- The sub-catchment areas were split into 0% impervious & 100% impervious areas; and
- The models were run through all storms from 10min to 72-hour durations for all AR&R generated storms to determine the critical storm events for each duration and AEP.

#### 4.2.2 Pre-Development Case Model

The pre-development scenario model consisted of nodes representing the pre-developed contributing catchments as described in section 4.2.1. A link with negligible energy loss was added to the downstream end of the pre-development scenario at each LPD and connected to an outfall node as to provide a single point of comparison for all catchments between the pre- and post-development cases.

#### 4.2.3 Post-Development Case Model

The post-development model includes the nodes for the catchments shown in **Table 2**. As noted in Section 3, the post-development catchments exhibit an increased fraction impervious in the post-development case over the pre-development case. A treatment basin is proposed downstream of each catchment in order to manage stormwater flows, with basins downstream of catchments that drain away from the lakes to also incorporate detention volumes. Catchments that drain to the existing lakes will be mitigated by additional detention to be provided in said lakes. Flows will enter these basins, then be released at a controlled rate in order to retard peak discharge to pre-development rates. For the performance of the basin with regard to treating flows for quality, see Section 5.

As stated previously, a link with negligible energy loss was added at each LPD and connected to an outfall node as to provide a single point of comparison for all catchments between the pre and post-development cases.

A step-wise linear table was used to represent the proposed basin volumes, as shown in **Table 6**.

**Table 6 – OSD Depth – Area Relationship**

| Catchment              | Depth | Surface Area (m <sup>2</sup> ) | Description                       |
|------------------------|-------|--------------------------------|-----------------------------------|
| C1                     | 0.00  | 500                            | Bioretention retained level       |

|                        | 0.48  | 26,897                         |                                   |
|                        | 0.68  | 28,427                         |                                   |
| C4                     | 0.00  | 69                             | Bioretention retained level       |
|                        | 0.40  | 142                            | Top of basin wall                 |
| C6                     | 0.00  | 250                            | Bioretention retained level       |
|                        | 0.40  | 875                            | Top of basin wall                 |

The proposed detention basin outlet arrangements are as shown in **Table 7** on the following page.

In order to achieve a no-worsening outcome it was also determined that modifications are required to the existing outlets from the lakes.

Proposed West Lake outlet modifications: The west lake has two outlets, one on the east side of the lake and one on the west side of the lake. It is proposed to remove one of the existing DN600 outlet pipes from the West Lake east outlet and to elevate the existing low point around the West Lake to prevent premature overflow from the lake.

Proposed East Lake outlet modifications: The east lake has a single outlet; a weir on the north side of the lake. The weir is not level, and is instead shown on the site survey to have a rounded bottom that will encourage channelisation of outflows. It is proposed to reduce the size of the channel in order to restrict outflows and slow the release of stormwater.

The proposed pre and post-development outlet arrangements for the lakes are as shown in **Table 8** and **Table 9**, with the location of the outlets shown on **Figure 3**.

**Table 7 – Proposed Basin Outlet Arrangement**

| Upstream Catchment  | Low Flow Outlet  | High Flow Outlet  | Emergency Overflow Weir  | Peak Water Level                          | Peak Volume         |
|---------------------|--|---|--|---|---------------------|
| C1                  | 200(H) x 800(W) orifice<br><br>Outlet invert to be equal to top of Bioretention retained level | 2x 200(H) x 800(W) orifice<br><br>Outlet invert to be 620mm above Bioretention retained level | 20m wide weir<br><br>1,250mm above Bioretention retained level | 1,287mm above Bioretention retained level | 899.4m <sup>3</sup> |

| Proposed Outlets | Description | DN600                      | Removed       | DN525       | N/A **     | 34m weir ** | 6m weir    |
|                  | IL (m AHD)  | 175.32                     | N/A           | 175.35      | N/A        | 175.7       | 175.85     |

\* Low points on top of bund around lake where water overflows simulated as weir outlets

\*\* Proposed to elevate the 8m low section of bund from an elevation of 175.5 to an elevation of 175.7m AHD

**Table 9 – Modification to East Lake Outlets**

|                  |             | Existing East Lake Outlets |                    |                    |                    |
|------------------|-------------|----------------------------|--------------------|--------------------|--------------------|
|                  |             | Weir<br>(Step 1) *         | Weir<br>(Step 2) * | Weir<br>(Step 3) * | Weir<br>(Step 4) * |
| Existing Outlets | Description | 9m weir                    | 5m weir            | 6m weir            | 12m weir           |
|                  | IL (m AHD)  | 170.00                     | 170.20             | 170.40             | 170.60             |
| Proposed Outlets | Description | 5m weir **                 | 0.8m weir **       | 0.8m weir **       | 0.8m weir **       |
|                  | IL (m AHD)  | 170.00                     | 170.20             | 170.40             | 170.60             |

\* Weir outlet is rounded rather than flat and has been simulated as 3 separate weirs at different levels to approximate this

\*\* Proposed to narrow the lower portion of the weir to restrict outflows

The proposed modifications to the lake outlets do not increase the water level in the lake under normal conditions, however during rainfall events, the proposed changes will result in increases to the peak water level in the lakes as shown in **Table 10**.

**Table 10 – Change in Peak Water Level in Lakes**

| Storm Event (AEP) | West Lake Peak Water Level (m) |                  |        | East Lake Peak Water Level (m) |                  |        |
|-------------------|--------------------------------|------------------|--------|--------------------------------|------------------|--------|
|                   | Pre-Development                | Post-Development | Change | Pre-Development                | Post-Development | Change |
| 50                | 175.419                        | 175.525          | +0.106 | 170.141                        | 170.203          | +0.062 |
| 20                | 175.479                        | 175.587          | +0.108 | 170.206                        | 170.283          | +0.077 |
| 10                | 175.468                        | 175.579          | +0.111 | 170.205                        | 170.292          | +0.087 |
| 5                 | 175.544                        | 175.644          | +0.100 | 170.302                        | 170.393          | +0.091 |
| 2                 | 175.618                        | 175.765          | +0.147 | 170.493                        | 170.553          | +0.060 |
| 1                 | 175.656                        | 175.799          | +0.143 | 170.569                        | 170.632          | +0.063 |

The increase in water level in the lake equates to an increase in storage above in the lakes as shown in **Table 11**.

**Table 11 – Change in Peak Stormwater Storage in Lakes**

| Storm Event (AEP) | West Lake Peak Water Level (m) |                  |        | East Lake Peak Water Level (m) |                  |        |
|-------------------|--------------------------------|------------------|--------|--------------------------------|------------------|--------|
|                   | Pre-Development                | Post-Development | Change | Pre-Development                | Post-Development | Change |
| 50                | 2,422                          | 5,068            | +2,646 | 1,854                          | 3,117            | +877   |
| 20                | 3,911                          | 6,640            | +2,729 | 2,776                          | 4,508            | +1,206 |

### 4.3 Peak Outflow Results

A comparison between the peak discharge values between each of the XP-STORM modelled scenarios is presented in **Tables 12 to 15**.

**Table 12 – XP-STORM Modelling Results, LPD 1**

| Design Storm | Pre-Development Flows (m <sup>3</sup> /s) | Post-Development Flows (m <sup>3</sup> /s) | Flow change (m <sup>3</sup> /s) |

| 2% AEP              | 3.470  | 3.422   | -1.38%                               |
| 1% AEP              | 4.165  | 4.099   | -1.58%                               |

## 4.4 Recommendation

As demonstrated in **Table 12** to **Table 15**, the provision of the OSD basins detailed in **Table 7** and the modifications to the lake outlets detailed in **Table 8** and **Table 9** is adequate to mitigate post-development peak discharge with no or negligible increase for each LPD for all peak storm events. The pre and post development catchment plans can be seen in **Appendix C** and further XP-STORM results refer to **Appendix E**.

## 5 STORMWATER QUALITY ASSESSMENT

This assessment identifies issues relating to stormwater runoff quality and assesses possible methods of treatment and the subsequent impacts on the drainage strategy. The aim of this section of the report is to determine practical approaches in achieving improvements for the quality of the stormwater run-off from the site as set out in the State Stormwater Strategy, the Meander Valley Planning Scheme and the MUSIC Modelling Guidelines, Version 1.0 (2010).

This section will address the following:

- ▶ Runoff to treatment devices; and
- ▶ Ensuring treatment device selection criteria is in accordance with Industry Best Practice and, WSUD Engineering Guidelines.

### 5.1 Site Analysis and Design Strategy

The pervious and impervious area for the proposed development is summarised in **Table 3** of this report. Currently no stormwater quality management measures are in place for the subject site. The proposed development offers the opportunity to provide stormwater quality treatment where none exists at present.

As the proposed development involves 500m<sup>2</sup> or more of additional impervious surface, under the State Stormwater Strategy the development is required to achieve the following stormwater management targets:

- ▶ 80% reduction in the annual average load of total suspended solids;
- ▶ 45% reduction in the annual average load of total phosphorus; and
- ▶ 45% reduction in the annual average load of total nitrogen.

A treatment train specific to each catchment was proposed to achieve the pollutant reduction requirements above. Stormwater quality improvement devices (SQIDs) implemented for each catchment were selected based on the location LPD, topography and existing infrastructure.

### 5.2 Stormwater Quality Improvement Devices (SQIDs)

The following SQIDs are proposed to be utilised on this project:

**Bioretention Basin** – A bioretention basin involves a basin with filter media and vegetation that is effective in removing nutrients from stormwater. They typically have a limited storage zone (detention) to allow stormwater to seep through the filter media to a series of underdrains prior to discharge. Bioretention basins can also be combined with OSD and thus is useful where precinct-wide detention is proposed at the downstream catchment discharge point.

### 5.3 MUSIC Modelling Results

The stormwater run-off for the site was modelled using MUSIC version 6.3.0. The site is located in the North Hydrologic Region of Tasmania, and the model uses the 6-minute rainfall data from the Launceston Airport monitoring site.

The utilised data was over a 10-year timeframe from 1/07/1996 to 30/06/2005. Pollutant export parameters for the catchment's different land use types were applied in accordance with Table 3.8 of the MUSIC Modelling Guidelines, Version 1.0 (2010). The objective was to achieve the desired target pollutant reduction levels as specified in the State Stormwater Strategy.

A MUSIC model analysis was undertaken for each LPD to determine the extent of the treatment required. Each catchment upstream of a given LPD was subdivided into roof, road and ground catchments with ground encompassing yards, hardstand areas, footpath and landscaped verges. Refer to **Table 3** for further details of each catchment.

The results for each catchment are presented below and meet the percent reduction water quality objectives identified by the State Stormwater Strategy development guidelines.

The treatment network is proposed as per **Figure 4**, subject to confirmation at the detailed design phase.

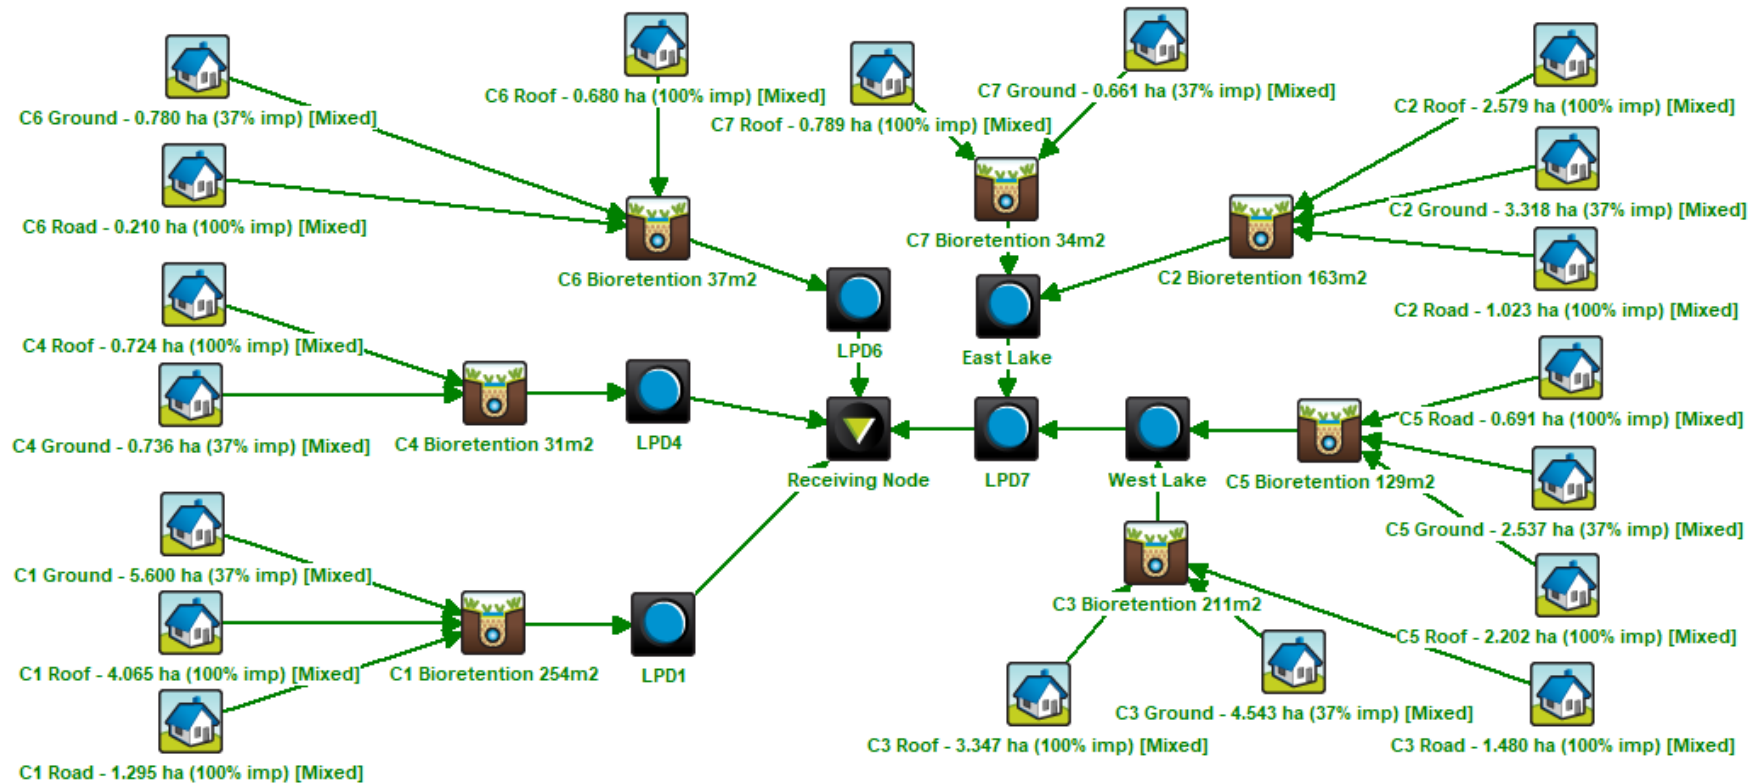

Figure 4 – MUSIC Model arrangement

### 5.3.1 LPD1 Results

A bioretention basin with filtration area of 254m<sup>2</sup> is adequate to treat the catchment upstream of LPD1 to the required standards prior to discharge. This incorporated a filter media depth of 0.4m and extended detention depth of 0.3m. The model arrangement is shown in **Figure 4** and results in **Table 16**.

**Table 16 – LPD1 MUSIC Model Results**

| Pollutant                    | Target Pollutant Reduction % | Pollutant Reduction Achieved % | Target Achieved |
|------------------------------|------------------------------|--------------------------------|-----------------|
| Total Suspended Solids (TSS) | 80                           | 81.1                           | Yes             |
| Total Phosphorus (TP)        | 45                           | 62.4                           | Yes             |
| Total Nitrogen (TN)          | 45                           | 45.4                           | Yes             |

### 5.3.2 LPD4 Results

A bioretention basin with filtration area of 31m<sup>2</sup> is adequate to treat the catchment upstream of LPD4 to the required standards prior to discharge. This incorporated a filter media depth of 0.4m and extended detention depth of 0.3m. The model arrangement is shown in **Figure 4** and results in **Table 17**.

**Table 17 – LPD4 MUSIC Model Results**

| Pollutant                    | Target Pollutant Reduction % | Pollutant Reduction Achieved % | Target Achieved |
|------------------------------|------------------------------|--------------------------------|-----------------|
| Total Suspended Solids (TSS) | 80                           | 80.5                           | Yes             |
| Total Phosphorus (TP)        | 45                           | 56.6                           | Yes             |
| Total Nitrogen (TN)          | 45                           | 45.5                           | Yes             |

### 5.3.3 LPD6 Results

A bioretention basin with filtration area of 38m<sup>2</sup> is adequate to treat the catchment upstream of LPD6 to the required standards prior to discharge. This incorporated a filter media depth of 0.4m and extended detention depth of 0.3m. The model arrangement is shown in **Figure 4** and results in **Table 18**.

**Table 18 – LPD6 MUSIC Model Results**

| Pollutant                    | Target Pollutant Reduction % | Pollutant Reduction Achieved % | Target Achieved |
|------------------------------|------------------------------|--------------------------------|-----------------|
| Total Suspended Solids (TSS) | 80                           | 82.4                           | Yes             |
| Total Phosphorus (TP)        | 45                           | 63.2                           | Yes             |
| Total Nitrogen (TN)          | 45                           | 45.4                           | Yes             |

### 5.3.4 LPD7 Results

A total bioretention filtration area of 537m<sup>2</sup> spread across five (4) basins as shown in **Figure 6** is adequate to treat the catchment upstream of LPD7 to the required standards prior to discharge. This

incorporated a filter media depth of 0.4m and extended detention depth of 0.3m. The model arrangement is shown in **Figure 4** and results in **Table 19**.

**Table 19 – LPD 7 MUSIC Model Results**

| Pollutant                    | Target Pollutant Reduction % | Pollutant Reduction Achieved % | Target Achieved |
|------------------------------|------------------------------|--------------------------------|-----------------|
| Total Suspended Solids (TSS) | 80                           | 81.4                           | Yes             |
| Total Phosphorus (TP)        | 45                           | 62.8                           | Yes             |
| Total Nitrogen (TN)          | 45                           | 45.0                           | Yes             |

As demonstrated, the catchment MUSIC Model results meet the percent reduction water quality targets identified by the State Stormwater Strategy development guidelines.

Refer to **Appendix D** for further information on the MUSIC Models.

## 5.4 Construction phase

During the construction phase of this development, there is a higher risk of sedimentation transport during construction due to the large areas of disturbed land. Best practice guidance on sediment and erosion control measures are to be conducted in accordance with relevant fact sheets under the Soil and Water Management on Building and Construction Sites by EPA Tasmania (2009).

A Soil and Water Management Plan (SWMP) is required for the lodgement of operational works and shall be implemented during the construction phase in accordance with Appendix 7 of the Tasmanian Subdivision Guidelines.

## 5.5 Operational phase

The proposed development has been and will continue to be designed to minimise the impact on stormwater quality and peak site discharge by managing stormwater at source using best management design practices to achieve the following stormwater management targets in accordance with the State Stormwater Strategy:

- ▶ 80% reduction in the annual average load of total suspended solids;
- ▶ 45% reduction in the annual average load of total phosphorus; and
- ▶ 45% reduction in the annual average load of total nitrogen.

Once directed to be commissioned by the superintendent and engineers, the Stormwater Quality Improvement Devices (SQIDs) will provide the required level of stormwater quality treatment to runoff from the site prior to discharging into Council's stormwater drainage infrastructure. It is expected that sediment laden runoff and the erosion potential at the subject site during the operational phase will be minimal. This is due to the high amount of permanent impervious area in the form of roofs, paths, courtyards, driveways and other impervious areas. The proposed landscaped areas will be maintained in a manner that will minimise erosion.

## 5.6 Lifecycle Costs

A lifecycle cost analysis is not a part of the scope of this report. All the recommended water quality treatment infrastructure lies within the development site and it shall be maintained and serviced by the owners of the development at **no cost to Council**.

## 5.7 Water Quality Monitoring

No water quality monitoring is proposed for this development at this stage due to the nature of the development and the fact that no monitoring currently takes place.

## 5.8 Maintenance

Following successful off-maintenance of the project, the proposed basin and associated stormwater infrastructure will be transferred to Council. It will be the responsibility of Council to maintain the proposed basins.

## 6 CONCLUSIONS

Detailed design is to confirm the water quality and quantity recommendations. In preparing this report, we have achieved all requirements for stormwater management plans as described in Council Planning Scheme, the Tasmanian Regional Subdivisional Guidelines, and the State Stormwater Strategy.

Detailed engineering diagrams and management requirements for the proposed development are to be submitted to Council for approval prior to any works commencing on site with design certification prepared by a qualified stormwater engineer or scientist.

## Appendix C

### ADG Preliminary Civil Plans

# PROPOSED DEVELOPMENT

## 100 COUNTRY CLUB AVE, PROSPECT VALE, TASMANIA, 7250

### CIVIL WORKS

#### NOTE:

- THE FOLLOWING INSPECTIONS MUST BE COMPLETED BY ADG ENGINEERS BEFORE ENGINEERING CERTIFICATION WILL BE ISSUED. THE CONTRACTOR IS TO PROVIDE A MINIMUM OF 72 HOURS NOTICE TO ADG FOR REQUIRED INSPECTIONS. SHOULD THE CONTRACTOR FAIL TO REQUEST AN INSPECTION, THE CONTRACTOR WILL BE RESPONSIBLE FOR ALL COSTS TO ALLOW FOR THE WORKS TO BE INSPECTED TO THE SATISFACTION OF ADG. ANY INSPECTIONS THAT FAIL ARE TO BE RE-INSPECTED WITH ALL REINSPECTION COSTS TO BE PAID BY THE CONTRACTOR.
- a) PRESTART
  - b) EARTHWORKS - FINAL STRIPPING OF TOPSOIL, INSTALLATION OF SEDIMENT AND EROSION CONTROL MEASURES
  - c) UNSUITABLE GROUND
  - d) SIDE AND CUT OFF DRAINS
  - e) STORMWATER PIPE LAID ON BEDDING PRIOR TO BACKFILL
  - f) STORMWATER TRENCH BACKFILLED PRIOR TO PAVEMENT PLACEMENT
  - g) STORMWATER STRUCTURE BASE SLABS
  - h) STORMWATER DETENTION TANKS

#### GENERAL NOTES:

- G1. ALL DIMENSIONS SHOWN ARE IN METERS UNLESS OTHERWISE SHOWN.
- G2. ALL SETOUT ON SITE IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR. CONTRACTOR TO ALLOW FOR ALL MEANS NECESSARY TO ACCURATELY SETOUT THE WORKS.
- G3. ALL WORKS TO BE CONSTRUCTED IN ACCORDANCE WITH PROJECT SPECIFICATIONS AND WHERE FURTHER DETAILS ARE REQUIRED THE CONTRACTOR SHALL REFER TO MEANDER VALLEY COUNCIL (MVC) DEVELOPMENT GUIDELINES, LOCAL WATER AUTHORITY GUIDELINES, ASSOCIATED STANDARD DRAWINGS AND SPECIFICATIONS U.N.O.
- G4. SHOULD ANY OF THE CONSTRUCTED WORKS BE CONSTRUCTED OUTSIDE OF THE TOLERANCES SPECIFIED WITHIN THE PROJECT SPECIFICATION AND LOCAL AUTHORITY REQUIREMENTS, THE CONTRACTOR WILL RECTIFY AT THEIR COST INCLUSIVE OF ANY ADDITIONAL COSTS INCURRED BY ADG.
- G5. EXISTING SERVICES HAVE BEEN PLOTTED FROM SUPPLIED DATA AND AS SUCH THEIR ACCURACY CANNOT BE GUARANTEED. NO RESPONSIBILITY IS TAKEN BY ADG OR THE PRINCIPAL FOR THE ACCURACY AND COMPLETENESS OF THIS INFORMATION. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO ACCURATELY ESTABLISH THE LOCATION AND LEVEL OF ALL EXISTING SERVICES PRIOR TO THE COMMENCEMENT OF ANY WORK. ANY DISCREPANCIES SHALL BE REPORTED TO THE SUPERINTENDENT. CONTRACTOR TO LOCATE AND PROTECT SERVICES AS REQUIRED DURING PROPOSED WORKS.
- G6. THE CONTRACTOR IS TO CHECK THROUGH LOCATING, POTHOLING AND SURVEY ALL CRITICAL CONNECTION POINTS FOR ALL CIVIL WORKS SHOWN ON THE DRAWINGS INCLUDING ANY POTENTIAL EXISTING SERVICES CLASHES PRIOR TO COMMENCEMENT OF CIVIL WORKS. CONTRACTOR TO IMMEDIATELY REPORT ANY DISCREPANCIES TO ADG AND AWAIT FORMAL DIRECTION PRIOR TO COMMENCING CIVIL WORKS.
- G7. ON COMPLETION OF SERVICES INSTALLATION, ALL DISTURBED AREAS SHALL BE RESTORED TO ORIGINAL LEVEL, INCLUDING KERBS, FOOTPATHS, CONCRETE AREAS, GRAVEL AREAS, GRASSED AREAS AND ROAD PAVEMENTS.
- G8. CONTRACTOR SHALL BE RESPONSIBLE FOR REPAIR OF ANY DAMAGE TO AUTHORITY/COUNCIL'S INFRASTRUCTURE. SUCH REPAIR OR REINSTATEMENT TO BE CARRIED OUT IMMEDIATELY TO THE SATISFACTION OF INFRASTRUCTURE OWNER/MANAGER / AUTHORITY/COUNCIL.
- G9. CONTRACTOR TO UNDERTAKE ALL WORKS IN ACCORDANCE WITH ALL WORKPLACE HEALTH AND SAFETY REQUIREMENTS.
- G10. WHERE ANY EXCAVATION OR CONSTRUCTION WORKS ARE TO BE IN CLOSE PROXIMITY TO NEIGHBOURING LOT BOUNDARIES OR INFRASTRUCTURE, CONTRACTOR TO ALLOW IN SCOPE OF WORKS TO PROVIDE ALL MEASURES NECESSARY TO ENSURE THE INTEGRITY OF EXISTING BOUNDARIES AND INFRASTRUCTURE. THIS MAY INCLUDE THE USE OF LOW VIBRATION EQUIPMENT, TRENCH SHORING ETC AS REQUIRED.
- G11. PRIOR TO THE CONTRACTOR COMMENCING ANY WORKS DETAILED ON THESE DRAWINGS, THE CONTRACTOR IS TO NOTIFY ADG ENGINEERS (AUST.) Pty. Ltd. AND RECEIVE WRITTEN CONFIRMATION THAT WORKS CAN COMMENCE
- G12. CONTRACTOR TO PROVIDE AS CONSTRUCTED DRAWINGS FOR ALL CONSTRUCTED WORKS IN ACCORDANCE WITH LOCAL GOVERNMENT REQUIREMENTS. UNLESS OTHERWISE ADVISED BY ADG ENGINEERS (AUST.) Pty. Ltd. CONTRACTOR TO NOTE COUNCILS ADAC REQUIREMENTS.
- G13. CONTRACTOR TO UNDERTAKE ALL WORKS IN ACCORDANCE WITH RELEVANT APPROVALS.
- G14. CONTRACTOR TO ALLOW TO LIAISE/CO-ORDINATE WITH ELECTRICAL, LANDSCAPE AND OTHER SERVICE CONTRACTORS THROUGHOUT CIVIL CONSTRUCTION.

## ADG CIVIL SERVICES

- i) BIO-RETENTION PRIOR TO INSTALLATION OF EACH LAYER
- j) SEWER RETICULATION
- k) WATER RETICULATION
- l) PAVEMENT SUBGRADE
- m) PAVEMENT REINFORCING
- n) PAVEMENT PRIOR TO SEALING (PRESEAL)
- o) RETAINING WALL FOOTING REINFORCING
- p) RETAINING WALL BLOCKWORK PRIOR TO CORE FILL
- q) STEEL REINFORCEMENT OF CONCRETE STRUCTURES
- r) PRACTICAL COMPLETION
- s) ON MAINTENANCE
- t) OFF MAINTENANCE
- u) ANY OTHER INSPECTION AS SPECIFIED BY LOCAL COUNCIL (REFER DEVELOPMENT APPROVAL)
- v) ANY OTHER INSPECTION AS REQUIRED BY THE WATER AUTHORITY AND WHERE RELEVANT TO THEIR CERTIFICATION SCHEME

## Appendix D

### MUSIC Model Data

## MUSIC Model Information

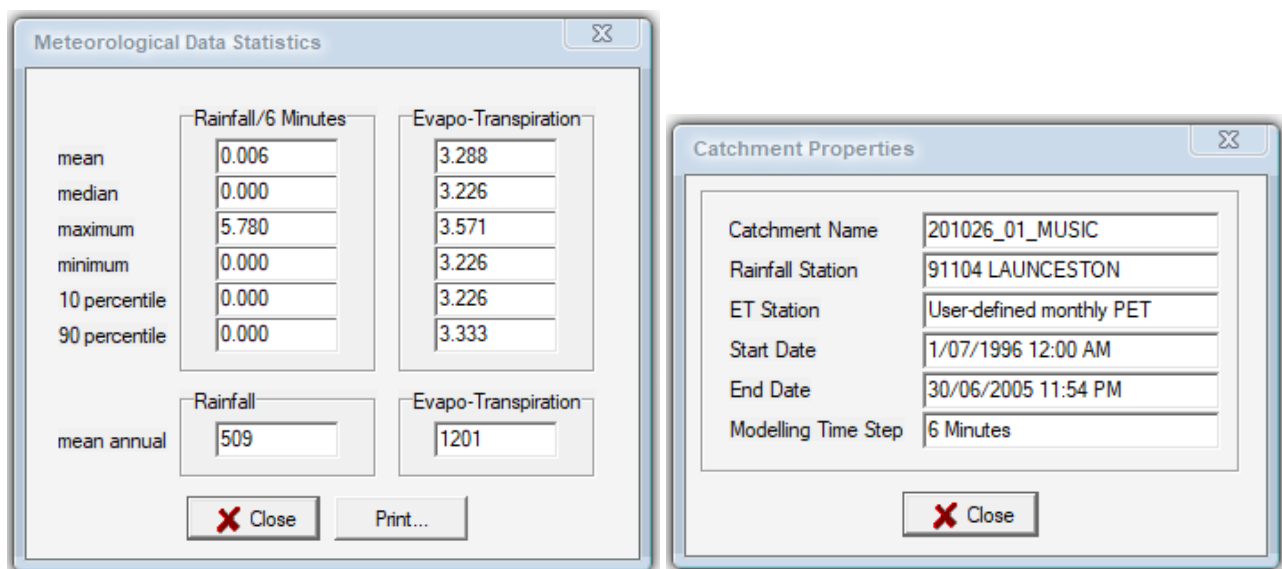

### Introduction:

The quality of stormwater runoff and the impact of the proposed stormwater quality improvement measures were analyzed using MUSIC Version 6.3.0 according to the *MUSIC Modeling Guidelines Version 1.0, Water by Design 2010*. The source nodes in the model are split into various types and a summary of the area breakdown is presented below:

### Meteorological Data:

The MUSIC model was carried out using the following parameters:

- Modeling period should be 10 years with a time step of 6 minutes
- The nearest available 6 minute time step rainfall series to the subject site is Launceston Airport, with a mean annual rainfall of 509 mm, and data from: 01/07/1996 to 30/06/2005

|               | Rainfall/6 Minutes | Evapo-Transpiration |
|---------------|--------------------|---------------------|
| mean          | 0.006              | 3.288               |
| median        | 0.000              | 3.226               |
| maximum       | 5.780              | 3.571               |
| minimum       | 0.000              | 3.226               |
| 10 percentile | 0.000              | 3.226               |
| 90 percentile | 0.000              | 3.333               |

|             | Rainfall | Evapo-Transpiration |
|-------------|----------|---------------------|
| mean annual | 509      | 1201                |

|                     |                          |
|---------------------|--------------------------|
| Catchment Name      | 201026_01_MUSIC          |
| Rainfall Station    | 91104 LAUNCESTON         |
| ET Station          | User-defined monthly PET |
| Start Date          | 1/07/1996 12:00 AM       |
| End Date            | 30/06/2005 11:54 PM      |
| Modelling Time Step | 6 Minutes                |

The mean annual evaporation was 1,201mm.

### Source Nodes, Fractions Impervious:

The areas of the source nodes were estimated based on Table 2 of the SMP by ADG Engineers and DA07 as shown in **Appendix C**.

### Source Nodes - Pollutant Exports:

Rainfall runoff and pollutant export parameters were assigned per **Tables 3.7** and **3.8** of the Water by Design MUSIC Modeling Guidelines Version 1.0 (2010).

The rainfall runoff and pollutant export parameters for an urban residential development were adopted.

**Subject:** Country Club Stormwater preliminary concepts

Hi all

Further to Stuart's email to Cam (see below) which has included some preliminary conceptual stormwater management, we have had a look and provide the following comments as these elements will likely have an influence on the future SAP:

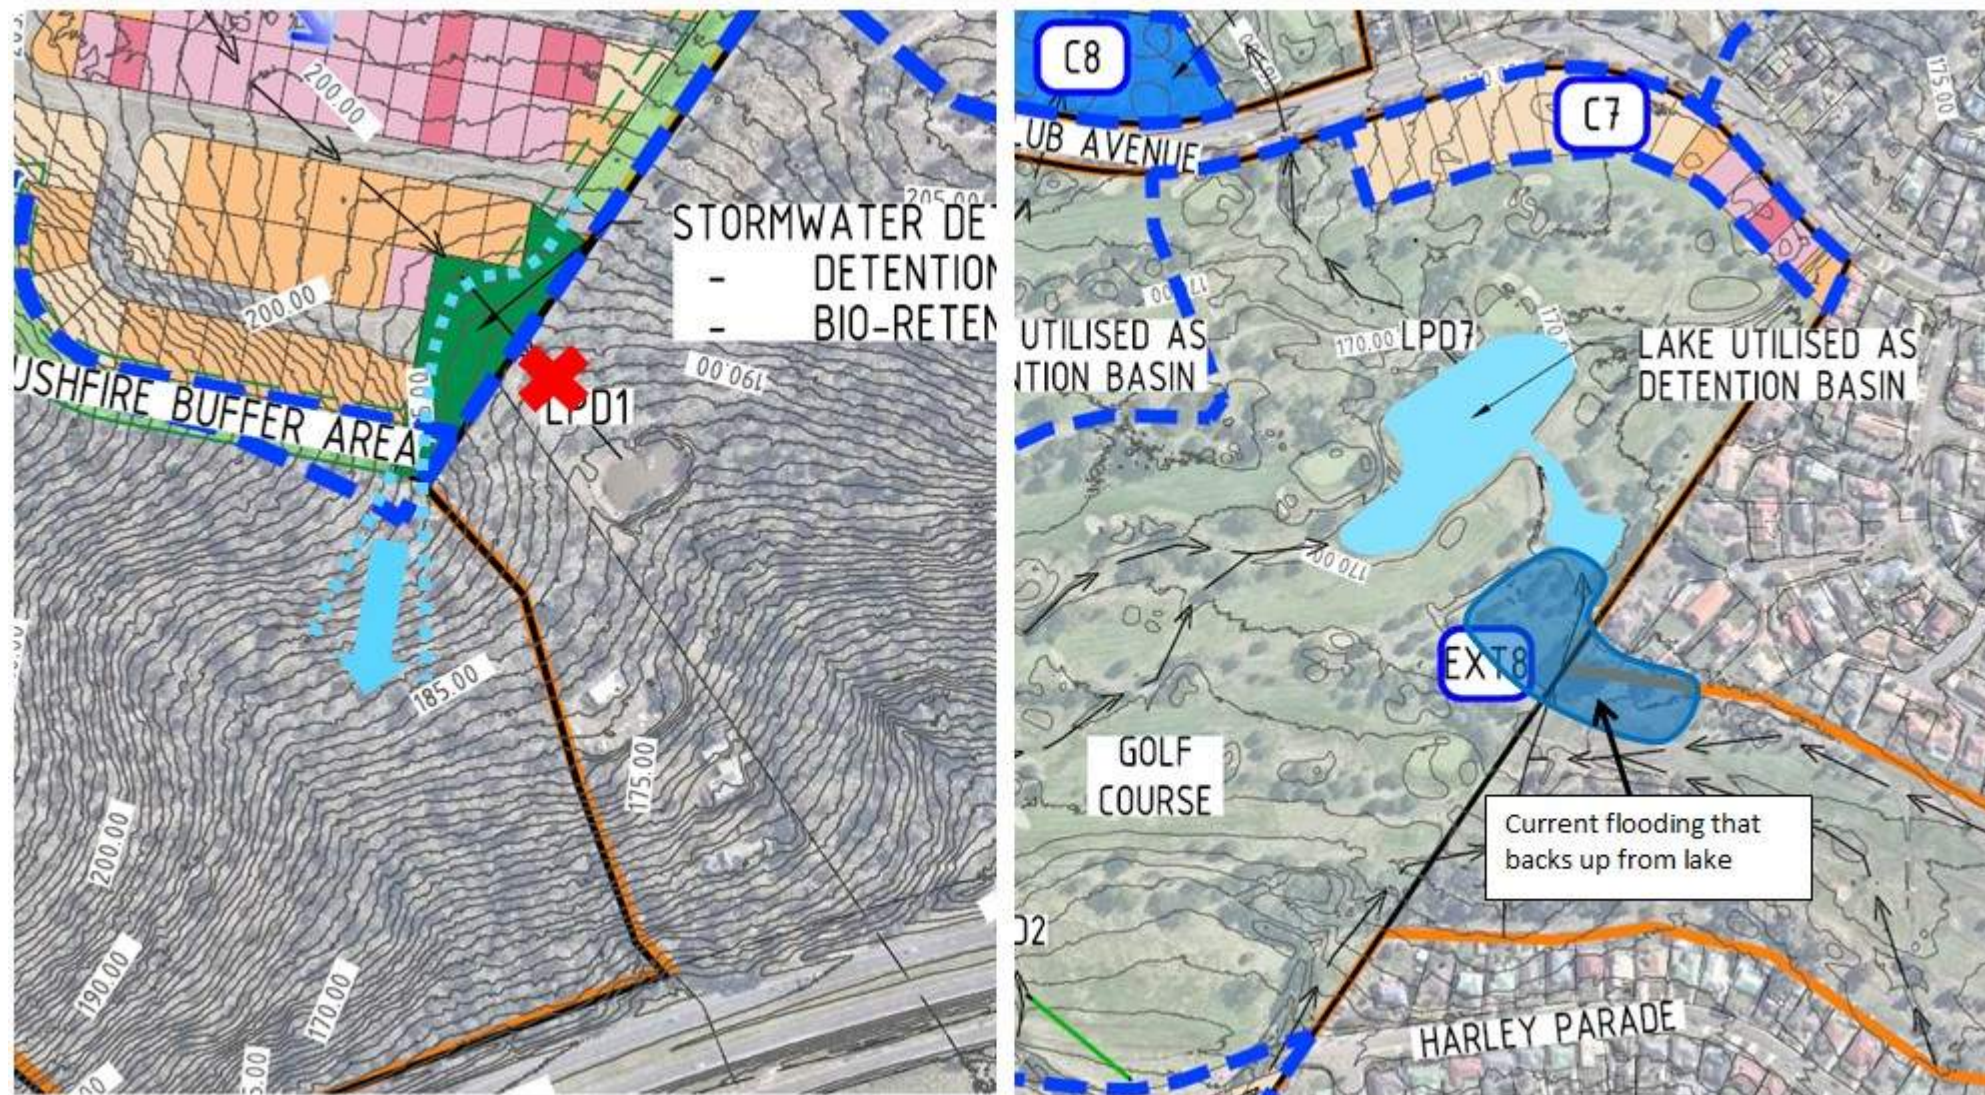

- 50% fraction impervious for blocks between 560 & 800+m2 is undercooked. We know that 66-70% is the going rate for our urban areas.
- The south eastern outlet into third party private land is not an option. It is not a public drainage course as defined in the Act and Council is not prepared to serve notice on the land owner. As a general rule we avoid taking over tight detention basin arrangements at the back of subdivisions. This is going to be bit of a difficult catchment to manage. Current position in here is that there be some sort of cut-off system that follows the contour and directs flows out through Country Club land and disperses over hillside to the south. See snip on left below. There will likely need to be some detention before discharge as the State Govt are really thingy about increasing stormwater loads to State highway drains (not impossible though if you can satisfy them that there is no adverse impact ... but they'll be painful)
- Further to email request below, Cam cannot simply plug these parameters into our model, it's not that straightforward and it's not his work to do. It's the developers responsibility to figure out how the increased loads for 1% event and overland flow paths can be managed, but we'll provide what we know thus far. Treatment of current lakes or civil works is a matter for the proponent to figure out in terms of what works for the existing users of the site and the increased inputs from the future development. Cam will provide our currently modelled flow rates at the outlet crossing point at Country Club Avenue. The aim is to ensure that as a minimum, pre-development flows are maintained at this point through detention etc. upstream, or alternatively that larger openings under the road and potential increase in pond size on the other side may do the job. Reason for this is that we know that we currently have flooding of adjacent private property due to the terrain being so flat on that eastern corner next to the lake. (see snip on right below) I understand Cam has provided a visual of the extent of golf course flooding? When we looked at this before, there was very little scope to use the existing lake for any additional substantive detention as Country Club did not want the water level lowered for golf course aesthetic reasons. Have you checked with them about how you're going to use those lakes for detention given that it appears the bulk of the stormwater load goes through this area? Alternative is new detention between the existing lakes. Either way, there has to be a general understanding about how this will be managed when development is established, though we don't need to go into territory of detail design.

Food for thought. Can discuss tomorrow.

Cheers

Jo

Hi Cameron,

**Re: Country Club Stormwater**

Please see attached preliminary pre and post development catchment plans for the proposed development with fraction impervious data included.

Regarding the stormwater management through the existing golf course as agreed with Council and subsequent to our conversations relating to the modelling outputs for this area, as we understand it forms a part of a much larger catchment, as such we would like you to enter the parameters on the attached plans into the overall model and advise if this is an acceptable outcome for the lakes and the discharge point at Country Club Avenue and receiving downstream waterways.

Catchments C1, C4, C8 & C6 and their contributing external catchments are independent of the lakes and have been treated and detained separately in accordance with MVC stormwater requirements, in our Stormwater Management Plan. All other lake catchments can be inserted to the Council flood model.

We await any advice necessary from you as to treatment of the current lakes, i.e raising of berms etc or any other civil works required for the functionality of the system as we propose.

Regards,

**Stuart Thienpont**
